Medical Diagnosis System Using Ripplet Transform

Hagote Kiran Kedarnath¹, Prof. Borkar B. S.²

¹²Information Technology, AVCOE Sangamner, India

Abstract -- Content-based image retrieval (CBIR) approach permits the user to extract a picture from an enormous database based mostly upon a question. An efficient and effective retrieval performance is achieved by selecting the simplest transform and classification techniques. However, the current transform techniques like Fourier Transform, cosine transform, wavelet transform suffer from discontinuities like edges in pictures. To overcome this disadvantage use Ripplet Transform (RT) has been implemented along with the neural network based mostly classifier referred to as Multilayered perceptron (MLP) for locating a good retrieval of image. Medical image fusion using PCNN and modified spatial frequency based on the ripplet transform type I. the source medical picture are divide by discrete RT(DRT), the low frequency sub bands (LFSs) are fused using the max selection rule. For the fusion of high frequency subbands (HFSs) a PCNN model is utilized. In the proposed medical diagnosis system use different technique like Mutual Information (MI), Spatial Frequency (SF) and Entropy (EN).

Keywords-- content-based image retrieval(CBIR), Image Fusion, Ripplet Transform, PCNN.

I. INTRODUCTION

Advances in data storage and image acquisition technologies have large databases, so as to deal with these data and to with efficiency manage these collections, it’s necessary to develop an economical image retrieval system. In Content based Image Retrieval (CBIR) system the pictures may be retrieved from outsized information supported the visual content information. The visual content of a picture is analyzed in terms of low-level features extracted from the image. These low level features embrace color, shape and texture fea. There are many transform techniques implemented for the feature extraction process. However the transforms techniques like Fourier Transform (FT) and wavelet Transform (WT)[2] suffer from discontinuities like edges and contours in images. In order to remove that conventional transforms an efficient technique known as Ripplet transform(RT) has been implemented for feature extraction. It is the next dimensional of the curvelet transform, create to show pictures at different scales and different directions partitioning 2 dimensional (2D) singularities on at random shaped curves.

In order to enhance the retrieval performance and to decrease the procedure complexities a neural network based mostly classification tool known as Multilayer perceptron (MLP) has been applied.

There are several MGA tools were proposed like Ridgelet, Curvelet and Contourlet etc. These MGA tools do not suffer from the problems of wavelet. for improve the fusion result used MGA tools [1], [3], [4]. For proposed technique used RT in the proposed method, because RT is capable of resolving two dimensional (2D) singularities and representing picture edges more efficiently. To handle this inequality regarding the importance/contribution of each of the source images in the fused image, different activity level measurements (ALMs) have been applied in the IF paradigm. PCNN is a visual cortex-inspired neural network and characterized by the global coupling and pulse synchronization of neurons [5], [6]. PCNN and it’s modified versions have been used in the IF paradigm by various researchers [7], [8], [9], [10]. The results of various research works show that PCNN outperforms the other conventional image fusion methods. However, in most of the existing IF methods based on PCNN, the value of single pixel (coefficient) in spatial or transform domain is used to motivate one neuron. The LFSs are fused using the ‘max selection’ rule, and the HFSs are fused using the PCNN and MSF.

Comparisons of the proposed method with some of the existing MIF schemes, show that. The paper is organized as. RT is described in Section 2. In Section 3, the standard PCNN model is briefly reviewed. Section 4, presents the proposed MIF algorithm. in section 5 shows the Results and other technique comparisons , and we draw conclusion in Section 6.

II. RIPPLET TRANSFORM(RT)

The conventional transforms like Fourier Transform(FT), Cosine Transform, Wavelet Transform(WT) suffer from discontinuities like edges and contours in pictures. To handle this problem, Jun XU et al. Proposed a new MGA-tool called RT. RT is a higher dimensional generalization of the Curvelet Transform (CVT), is used to represent picture or 2D signals at different scales and different directions.
Ripplet Transform used to create a new tight frame with sparse representation for picture with discontinuities along Cd curves [12].

A. Continuous Ripplet Transform (CRT)

For a two dimensional integrable $f(x)$, the CRT is defined because the real number of $f(x)$ and ripplets as $\varphi_{\theta, \beta}(x)$ given in

$$R(\alpha, \beta, \theta) = (f(x)\varphi_{\theta, \beta}(x))$$

(1)

Where $R(\alpha, \beta, \theta)$ are the coefficients as ripplet and $(.)$ denote operator as conjugate. The ripplet function of the equivalent $l$ is defined as

$$\varphi_{\theta, \beta}(x) = \varphi_{\theta, \beta}(R_{\theta}(x - \beta))$$

(2)

Where $\varphi_{\theta, \beta}$ is that the ripplet part perform given by the shape

$$R_{\theta} = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$$

(3)

The equation (3) shows the rotation matrix, where $x$ and $\beta$ are 2D vectors; $b \& \theta$ denotes the position parameter and rotation parameter severally. The ripplet part perform is defined in frequency domain as

$$D_{\alpha}(r, \omega) = \frac{1}{\sqrt{c}}a^{1/2a}W(a, r)\sqrt{\frac{1}{c, \alpha}}V(\frac{1}{c, \alpha})$$

(4)

Where $D_{\alpha}(r, \omega)$ is that the Fourier remodel of $\varphi_{\theta, \beta}$ in coordinate system, and $a$ is that the scale parameter. $W(r)$ is that the "radial-window" and $V(\omega)$ is the "angular window". There are 2 side have supports at point $[1/2, 2]$ and [-1, 1] severally. They satisfy the subsequent acceptableness conditions:

$$\int^{1/2}_{-1/2}W^{2}(r)dr = 1$$

(5)

$$\int^{1}_{-1}\nu^{2}(\theta)d\theta = 1$$

(6)

B. Discrete Ripplet Transform (DRT)

As digital image process wants distinct transform rather than continuous remodel, here we describe the discretization of R T [6]. The discretization of CRT(Continuous ripplet remodel is based on the discretization of the parameters of ripplet functions $a, \beta, \theta$, substitute $a, \beta, \theta$ respectively, and satisfy that $a_j = 2^{-j}, \beta_k = [c_{k_x}, k_{y}, 2^{-1/d}k_{y}]^T$ and $\theta_l = \frac{2\pi}{c\cdot2^{-[d\cdot(l-1/d)]}}j$, where $k = [k_x, k_y, l]^T$, and $j, k_x, k_y, l \in \mathbb{N}$. $(^T)$ denotes the transpose of a vector $d \in \mathbb{N}$, since any real number may be approximated by rational numbers, so we will represent $d$ with $d=n/m$ and $n,m \in \mathbb{N}$. Usually, we prefer $n,m \in \mathbb{N}$ and $n; m$ are measure each primes. Within the frequency domain, the corresponding frequency response of ripplet perform is within the type:

Figure. The application of polar frequency domain. (The shaded 'wedge' corresponds to the frequency remodel of the part function).
\[ \rho_j(\mathbf{r}, \omega) = \frac{1}{\sqrt{c}} \alpha^{\frac{3m+2}{2}} W(2^{-j} \mathbf{r}) V(\frac{1}{c} 2^{\frac{3m+2}{2}} \omega - \mathbf{l}) \]  

(7)

Where W and V satisfy the subsequent acceptableness conditions:

\[ \sum_{j=-\infty}^{\infty} |W(2^{-j} \mathbf{r})|^2 = 1 \]  

(8)

\[ \sum_{j=-\infty}^{\infty} |V(\frac{1}{c} 2^{\frac{3m+2}{2}} \omega - \mathbf{l})|^2 = 1 \]  

(9)

given c, d and j. The ‘wedge’ comparable to the ripplet perform within the frequency domain is

\[ H_{j,k}(f,\theta) = \{ |r| = 2^j \} \left( \frac{\pi}{c} 2^{\frac{3m+2}{2}} \omega \right) \left( \frac{\pi}{2} 2^{-j} \right) \]  

(10)

The DRT of an M x N image \( f(n_1, n_2) \) are within the form of

\[ R_{j,k,l} = \sum_{n_1=0}^{M-1} \sum_{n_2=0}^{N-1} f(n_1, n_2) \rho_{j,k,l}(n_1, n_2) \]  

(11)

As a generalized version of the present curvelet transform, RT is not only capable of resolution second Dimensional singularities, but it additionally has few smart properties [7]:

1. It forms a brand new tight enclose a perform house. And is capable of localizing in spatial and frequency domain providing a additional economical and effective representation for images or 2D signals.
2. It has general scaling with impulsive degree and support that will capture second singularities on different curves in any directions. Jun XU et al. have showed that RT will give a more practical representation for pictures with singularities on smooth curves [6].

III. PULSE COUPLED NEURAL NETWORK

PCNN may be a single stratified, two-dimensional, and laterally connected neural network of pulse coupled neurons. The PCNN neurons structure is shown in Fig. 2. The nerve cell consists of Associate in Nursing input half (dendritic tree), linking half and a generator. The nerve cell receives the input signals from feeding and linking inputs. Feeding input is that the primary input from the neurons receptive space,. the quality PCNN model is delineate as iteration by the subsequent equations [10],[11],[13].

\[ F_{i,j}[n] = e^{-\alpha t} F_{i,j}[n-1] + V_L \sum_{i,j} w_{i,j,l} Y_{i,j}[n-1] + S_{i,j} \]  

(12)

\[ L_{i,j}[n] = e^{-\alpha t} L_{i,j}[n-1] + V_L \sum_{i,j,k,l} m_{i,j,k,l} Y_{i,j}[n-1] \]  

(13)

\[ U_{i,j}[n] = F_{i,j}[n] (1 + \beta L_{i,j}[n]) \]  

(14)

\[ Y_{i,j}[n] = \begin{cases} 1, & U_{i,j}[n] > T_{i,j}[n] \\ 0, & \text{otherwise} \end{cases} \]  

(15)

\[ T_{i,j}[n] = e^{-\alpha t} T_{i,j}[n-1] + V_L Y_{i,j}[n] \]  

(16)

In the Eq.(12) to Eq.(16), the indexes i and j seek advice from the pixel location within the image, k and l seek advice from the dislocation in an exceedingly symmetric neighborhood around one pixel, and n denotes the current iteration (discrete time step). Here n varies from one to N (total variety of iterations). The dendritic tree is given by Eqs.(12)-(13).The 2 main elements F and L area unit known as feeding and linking, severally. \( W_{l,j,k,l} \) and \( m_{i,j,k,l} \) area unit the synaptic weight coefficients and S is that the external input.
V_F and V_L area unit normalizing constants. α_F and α_L area unit the time constants; usually, α_F < α_L. The linking modulation is given in equivalent weight Eq.(16), wherever U_{i,j}[n] is that the internal state of the neuron and β is that the linking parameter. The heart beat generator determines the firing events within the model in equivalent weight Eq.(15). Y_{i,j}[n] Depends on the inner state and threshold. The dynamic threshold of the nerve cell is equivalent Eq.(16), where V_T and α_T area unit normalized constant and time constant, severally.

IV. PROPOSED METHOD

The notations used in this section as follows: A, B, R represents the 2 source pictures and therefore the resultant image, severally. C = (A,B,R). L_* indicates the LFS of the image C at the coarsest scale G. D^{c}_{g,h} represents the HFS of the image C at scale g, (g = 1,...,G) and direction h. (i; j) denotes the spatial location of every coefficient. The method is simply extended to more than two pictures.

A. Fusing Low Frequency Subbands

The LFSs coefficients area fused using ‘max selection’ rule. According to this fusion rule, choose the frequency coefficients from L^{A}_{g} or L^{B}_{g} with larger definite quantity because the fused coefficients:

\[ L^{R}_{g}(i, j) = \begin{cases} L^{A}_{g}(i, j), & \text{if } L^{A}_{g}(i, j) \geq L^{B}_{g}(i, j) \\ L^{B}_{g}(i, j), & \text{otherwise} \end{cases} \]  

B. Fusing High Frequency Sub Bands

The HFSs of the supply pictures are fused PCNN. As humans area unit sensitive to options like edges, contours etc., so rather than PCNN in DRT domain directly (i.e., using individual coefficients), changed spatial frequency (MSF) in DRT domain is taken into account because the image feature to inspire the PCNN.

1) Modified Spatial Frequency (MSF): spatial frequency (SF) projected by Eskicioglu et al. is calculated by row and column frequency [14]. It reflects the entire activity level of an image, which implies the larger the SF, the upper the image resolution. We have used a changed version of SF within the proposed MIF technique. The MSF consists of row (RF), column (CF) and diagonal frequency (DF). For a M×N pixels image f the MSF is outlined as

\[ M\, SF = \sqrt{R\, F^2 + C\, F^2 + D\, F^2} \]  

Where,

\[ RF = \sqrt{\frac{1}{M(N-1)} \sum_{m=1}^{M} \sum_{n=2}^{N} [f_{m,n} - f_{m,n-1}]^2} \]  

\[ CF = \sqrt{\frac{1}{(N-1)M} \sum_{m=2}^{M} \sum_{n=1}^{N} [f_{m,n} - f_{m-1,n}]^2} \]  

And,

\[ DF = P + Q \]  

Where,

\[ P = \frac{1}{(M-1)(N-1)} \sum_{m=2}^{M} \sum_{n=2}^{N} [f_{m,n} - f_{m-1,n}]^2 \]

And,

\[ Q = \frac{1}{(M-1)(N-1)} \sum_{m=2}^{M} \sum_{n=2}^{N} [f_{m-1,n} - f_{m,n}]^2 \]  

2) Fusion Using DRT-MSF-PCNN:

Let, M\, SF^{g,h,c}_{i,j} be the changed spatial frequency similar to a coefficient D^{g,h}_{i,j}, measured by using overlapping window around the involved coefficient where C = (A,B), so as to reduce the machine complexness, we tend to use a simplified PCNN:

\[ F^{g,h,c}_{i,j}[n] = M\, SF^{g,h,c}_{i,j} \]  

\[ L^{g,h,c}_{i,j}[n] = e^{-\alpha} L^{g,h,c}_{i,j}[n-1] + \sum_{h',l'} W^{g,h,c}_{i,j,h',l'} Y^{g,h,c}_{i,j,h',l'}[n-1] \]  

\[ U^{g,h,c}_{i,j}[n] = F^{g,h,c}_{i,j}[n] + \beta L^{g,h,c}_{i,j}[n] \]  

\[ \theta^{g,h,c}_{i,j}[n] = e^{-\alpha} \theta^{g,h,c}_{i,j}[n-1] + V_{i,j} Y^{g,h,c}_{i,j}[n-1] \]  

\[ Y^{g,h,c}_{i,j}[n] = \begin{cases} 1, & \text{if } \theta^{g,h,c}_{i,j}[n] > 0 \\ 0, & \text{otherwise} \end{cases} \]  

\[ T^{g,h,c}_{i,j}[n] = T^{g,h,c}_{i,j}[n-1] + T^{g,h,c}_{i,j}[n] \]
Where, the feeding input \( F_{i,j}^{g,h,C} [n] \) up to the normalized modified spatial frequency \( MSF_{i,j}^{g,h,C} \). The linking input \( L_{i,j}^{g,h,c} \) is up to the total of neurons firing times in linking range. \( W_{i,j,k,l} \) is that the conjunction gain strength and subscripts \( k \) and \( l \) area unit the dimensions of linking range the PCNN. \( \alpha_L \) is the decay constants. \( \beta \) is that the linking strength, \( V_L \) and \( V_\theta \) area unit the amplitude gains. \( U_{i,j}^{g,h,C} \) is that the total internal activity and \( \theta_{i,j}^{g,h,C} \) is the threshold. If \( U_{i,j}^{g,h,C} \) is larger than \( \theta_{i,j}^{g,h,C} \), then the nerve cell can generate a pulse \( Y_{i,j}^{g,h,C} = 1 \), is known as one firing time. The total of \( Y_{i,j}^{g,h,C} = 1 \) in \( n \) iteration (namely the firing times), is employed to represent the image info. Here, instead of \( Y_{i,j}^{g,h,C} [n] \), we've analyzed \( T_{i,j}^{g,h,C} [n] \), since neighboring coefficients with similar options represent similar firing times in an exceedingly given iteration times.

C. Algorithm

The medical pictures to be coalesced at pixels area unit aligned. Here we tend to outlines the salient steps of the projected MIF method:

1) Decompose the registered supply medical pictures A and B by DRT to get the LFSs and HFSs.

2) Fused the coefficients of LFSs using the ‘max selection’ rule delineate in Section IV-A, to get the fused LFS.

3) Compute the MSF as delineate in Section IV-B1, using overlapping window on the coefficients in HFSs.

4) Input MSF of every HFSs to inspire the PCNN and generate pulse of neurons with Eqs.(24)–(29). and cypher the firing times \( T_{i,j}^{g,h,C} [n] \) by equivalent weight.(31).

5) If \( n = N \), then iteration stops. Then fuse the coefficients in the HFSs by the subsequent fusion rule:

\[
D_{i,j}^{g,h,C} [n] = \begin{cases} 
D_{i,j}^{g,h,C} [\text{otherwise)}] & \\
T_{i,j}^{g,h,C} [n] & \text{if } n = N 
\end{cases}
\] (30)

6) Apply inverse ripplet remodel (IDRT) on the fused LFSs and HFSs to get the ultimate fused medical image. The diagram of the projected MIF theme is shown in Fig. 3.

Figure 3. Diagram of the projected MIF technique.

V. RESULTS AND OTHER TECHNIQUE COMPARISON

The projected MIF technique, extensive experiments were carried out on numerous modalities of medical pictures. Fig. 4(a)-(b) and Fig. 4(c)-(d) shows 2 different sets of supply pictures used in the analysis, and are show by IS1 and IS2, severally. The CT image in Fig. 4(a) shows the bones and therefore the MRI image in Fig. 4(b) displays the soft tissues info. The T1- weighted man image in Fig. 4(c) of IS2 contains the soft tissues however no illness info, and therefore the MRA image in Fig. 4(d) shows the illness info (shown by the marked ellipse) however no soft tissues info. The decomposition parameter of DRT was levels = [1, 2, 4, 4]. Parameters of PCNN was set as \( k \times l = 3 \times 3 \), \( a_\theta = 0.2 \), \( \beta = 0.2 \), \( V_L = 1.0 \), \( V_\theta = 20 \),

\[
W = \begin{pmatrix} 
0.707 & 1 & 0.707 \\
1 & 0 & 1 \\
0.707 & 1 & 0.707
\end{pmatrix}
\]

and \( N=200 \).
To show the effectiveness of the projected technique, visual as well as quantitative chemical analysis were administrated. The chosen quantitative criterions employed in the experiments area unit as follows:

A. Standard Deviation (STD)

It measures the distinction within the fused image. a picture with high distinction would have a high variance.

$$STD = \sqrt{\frac{1}{MN} \sum_{m=1}^{M} \sum_{n=1}^{N} (F(m,n) - MEAN)^2}$$ (30)

Where M × N denotes the image dimension and the gray-value of the pixel element of image F at position (m, n) indicates F(m, n) and

$$MEAN = \frac{1}{MN} \sum_{m=1}^{M} \sum_{n=1}^{N} |F(m,n)|$$ (31)

B. Entropy (EN)

The entropy of a picture may be a live of knowledge content. It’s the common variety of bits required to quantize the intensities within the image. It’s outlined as

$$EN = -\sum_{g=0}^{L-1} p(g) \log_2 p(g)$$ (32)

Where p(g) is that the likelihood of grey-level g, and therefore the vary of g is [0, ..., L-1]. A picture with high info as high entropy. Suppose entropy of fused image is over parent pictures then it indicates that the coalesced image contains more information.

C. Spatial Frequency (SF)

Spatial frequency is accustomed live the general activity and clarity level of a picture. Larger SF worth denotes higher fusion result:

$$SF = \sqrt{RF^2 + CF^2}$$ (33)

Where RF is that the row frequency and CF is that the column frequency:

$$RF = \sqrt{\frac{1}{M(N-1)} \sum_{m=1}^{M} \sum_{n=2}^{N} [f_{m,n} - f_{m,n-1}]^2}$$ (34)

$$CF = \sqrt{\frac{1}{(N-1)M} \sum_{m=2}^{M} \sum_{n=1}^{N} [f_{m,n} - f_{m-1,n}]^2}$$ (35)

Where M × N denotes the dimensions of image and the gray-value of the picture element of image F at position (m, n) as indicates F(m, n).

D. MI

A larger measure implies higher quality. Given 2 pictures x_F and x_R MI is outlined as [15].

$$MI = I(x_F;x_R) + I(x_R;x_F)$$ (36)

Where

$$I(x_F;x_R) = \sum_{u=1}^{L} \sum_{v=1}^{L} h_{RF}(u,v) \log_2 \frac{h_{RF}(u,v)}{h_R(u)h_F(v)}$$ (37)

Where h_R, h_F area unit the normalized grey level histograms of x_F and x_R , severally. h_{RF} is that the joint grey level bar graph of x_F and x_R , and L is that the variety of bins. x_F and x_R correspond to the reference and fused pictures, severally. I(x_R;x_F) indicates what proportion info the fused image x_F conveys regarding the reference x_R . Thus, the upper the mutual info between x_F and x_R , the a lot of possible x_F resembles the best x_R . An professional practician was asked to subjectively judge the effectiveness of the projected MIF technique. When careful manual inspection, the practician conformed to the effectiveness of the projected theme.
He found that the coalesced pictures obtained by the projected MIF theme, were a lot of clear, informative and have higher distinction that is useful in image as well as interpretation.

![Figure 5. Results of the projected MIF theme (a) fused image of IS1; (b) fused image of IS2](image_url)

To integrate as much information as possible into the fused images the low frequency source subbands are fused using 'max selection' rule, and PCNN is used to select the 'better' coefficients from the decomposed source high frequency subbands. To improve the result, instead of using single coefficient to motivate the PCNN, modified spatial frequency is used as the image feature to motivate the PCNN. The proposed MIF method is analyzed both visually and quantitatively, and is compared with several existing IF techniques, and the superiority of the proposed scheme is established.

### Acknowledgment

We would like to thank to my college AVCOE sangmaner and my guide Prof. Borkar B.S for helping us in the implementation of medical Diagnosis system using Ripplet Transform.
