Equality in between Iterative Soft Dilation and Iterative Soft Open in Multi Scale Environment

Kompella Venkata Ramana
Ph.D, Associate Professor, Computer Science and Systems Engineering Dept., Andhra University, India

Abstract: This paper discusses a fundamental property of soft mathematical morphology which is a narrow area of image processing. In this paper, equality is established and discussed in between soft dilation and soft open in multi scale environment as well as in iterative environment. Soft erosion and soft dilation will exist for various thresholds. Soft open and soft close also exist for various thresholds. If definition for soft erosion and soft dilation are studied (5), then some type of equalities are viewed among soft morphological operations. So equality may be established in between soft erosion and soft dilation in multi scale environment (47). Open and close are composite operations. So soft open and soft close are also composite operations which will exist at various thresholds. Equality may be viewed among all soft morphological operations.

As part of that, in this paper equality is studied in between soft dilation and soft open in multi scale as well as iterative environment. A very important point is that equality does not exist in mathematical morphology but will exist in soft mathematical morphology.

Keywords— Mathematical morphology, Mathematical soft morphology, Soft morphology, Erosion, Dilation, Soft erosion, Soft dilation, Primitive morphological operation, equality, threshold, Iterative morphology, Multi scale morphology, Soft open, soft close.

The paper is divided into 8 sections.

8. REFERENCES

I. INTRODUCTION AND MATHEMATICAL MORPHOLOGY

The human beings have the desire of recording incidents, through images. It has started from early cavemen also.

Later, so many techniques, to get the images and so many techniques, to process the images are developed. After assembling of computers, image processing was expanded.

In 1964 G. Matheron was asked to investigate the relationships between the geometry of porous media and their permeability. At the same time, J. Serra was asked to quantify the petrography of iron ores, in order to predict their milling properties. (1, 2) At the same time a centre was developed to study mathematical morphological techniques in Paris school of mines, France. Mathematical morphology can provide solutions to many tasks, where image processing can be applied, such as in remote sensing, optical character recognition, Radar image sequence recognition, medical image processing etc.,

In mathematical morphological operations, Erosion and Dilation are primitive operations (3,4). Open and close are composite operations.

Dilation: - These operations may be defined in so many ways. Different researchers defined this operation in different ways.

Def. 1:- Let A and B be subjects of \( E^N \) (where N is Space) the dilation of A by B, is denoted by \( A \oplus B \) and is defined by \( A \oplus B = \{ C / C = a + b \text{ for some } a \in A \text{ and } b \in B \} \)

Def. 2:- \( A \oplus B = U (A)_b \)

\( \in B \) Where A is the image and B is the structuring element.

Here \( (A)_b \) means, translation of A by b, defined as 

\( (A)_b = \{ C / C = a + b; \ a \in A \} \)

Def. 3:- \( (I \oplus S) \ [x, y] = 1 \text{ if } | I \cap S ' (x, y) | \geq 0 \text{ otherwise.} \)

Here, I is the image

\( S ' : \) reflection of S about the origin

[If S.E. is having origin, at its centre point then \( S = S ' \)].

I (x, y) denotes image pixel value at the coordinate (x, y)
In mathematical morphology, some type of the concept “All” will play major role. In Erosion, the O.P. will be “1”, if all elements of the sub image are equal to 1, otherwise, the output will be “0”. In dilation, the O.P. will be “0”, if all elements of the sub image are equal to “0”. Otherwise the output will be “1”. This “All” concept, will cause some type of inconvenience. So some type of flexibility is introduced, in the form of threshold value. So, this morphology with threshold is defined as soft morphology. So, this soft morphology is having a few advantages, which the mathematical morphology operations don’t have.

So, the Soft Morphology can be considered as extension to mathematical morphology. Even though mathematical morphological operators are efficient, they suffer with a few drawbacks as specified above. In addition to above, some more comments are………. In primitive morphological operations, erosion, one or two mismatched pixels of image prevent the structuring element from fitting perfectly. It is the basic morphological operation, quantifies the way in which, the structuring element fits into the image. Erosion is an “All or nothing” transformation, implemented using bitwise “and”. So, erosion will be sensitive to noise.

In primitive morphological operations, dilation, isolated pixels, even though, they are irrelevant to the image’s content, significantly affect the output of the transformation. The net effect is an increased number of large spurious particles, increasing the confusion in the transformed image. So, noise will be added, which may be named as additive noise. (5)

But, many applications require more tolerance to noise than is provided by erosion and dilation. Soft morphological operators possess many of the characteristics, which are desirable, perform better in noisy environments. (5)

So, the soft morphological filters, improve the behavior of standard morphological filters, in noisy environment. The soft morphological filters are better compared to mathematical morphology in small detail preservation and impulse noise. In soft morphology, it preserves details, by adjusting its parameters (11). It can be designed in such a way that, it performs well in removal of salt – and – pepper noise as well as Gaussian noise, simultaneously. (12)

The idea of soft morphological operations is to relax, the standard morphological definition, a little, in such a way that, a degree of Robustness is achieved, While, most of the desirable properties of standard morphological operations are maintained. The soft morphology was introduced by KOSKINEN etc, and developed by researchers.

2.1 Discussion On Definition:-

In some papers, researchers proposed soft morphology using two sets of structuring elements.

A) The core
B) The soft boundary [7,8,9 etc].

But, in some papers [5 etc.] they proposed soft morphology, by counting logic. They have done the counting of ones, in the particular sub image, chosen. Then they have applied threshold value, for soft Erosion and soft dilation.
Soft dilation was defined as (5)
\[(I \oplus S^{(m)})[x, y] = 1 \text{ If } |I \cap S_{(x,y)}| \geq m \]
\[= 0 \text{ otherwise.} \]
|S| is the cardinality of S.

Soft Erosion may be defined as
\[(I \ominus S^{(m)})[x, y] = 0 \text{ If } |\hat{I} \cap S_{(x,y)}| \geq m \]
\[= 1 \text{ otherwise. } \hat{I} = \text{ inversion of } I; m= \text{ threshold value } \leq |S|. \]

[The exact definition, given in “5”, is slightly modified, according to the requirement, but without changing the meaning. Here the main assumption is origin is at central place of the structuring element and structuring element is assumed to be a square grid.] Here “m” is threshold value.

Soft open and soft close are defined by above soft erosion and soft dilation.: some convention is discussed in the next section.

III. Iterative Soft Morphology

It can be defined as, applying a morphological operation on an image, a few number of times.

3.1 Convention: symbolically, \((X \ominus Y)\) means applying erosion by S.E. Y, on image X.\((X \Theta 2Y)\) means, applying Erosion by S.E. Y, on image X, twice. \((X \ominus 3Y)\) means, applying Erosion by S.E. Y, on image X, thrice. \((X \ominus NY)\) means, applying Erosion by S.E. Y, on image “X”, “N” number of times, in the same way.

\((X \Theta NY)\) means, applying dilation by S.E. Y, on image “X” , \(N\) no of times.\((X \ominus O NY)\) means, applying open by S.E. Y, on image “X”, \(N\) number of times. But it is idempotent operation. \((X \ominus \bullet NY)\) means applying close by S.E. Y, on image “X”, \(N\) number of times. But it is also idempotent operation. This iterative morphology will have applications in the design of composite morphological operations (Morphological Algorithms) skeletonization, thinning, thickening etc.

The applications may also be seen in structuring element Decomposition, segmentation, etc.

Iterative morphology may be extended to iterative soft morphological environment also. In iterative soft morphological environment, the following convention may be used.

\((E_{(1)})^3\) : Soft Erosion, with threshold value = 1 applied, 2 times on the image.

\((E_{(2)})^5\) : Soft Erosion, with threshold value = 1 applied, 5 times on the image.

\((E_{(3)})^3\) : Soft Erosion, with threshold value = 1 applied, “y” times on the image.

\((E_{(1)})^3\) : Soft Erosion, applied with threshold values, 1,2,3 on the image.

\((E_{(2)})^3\) : Soft Erosion, applied with threshold values, x,y,z on the image.

\((D_{(1)})^3\) : Soft Dilation, with threshold value “1” applied “3” times on the image.

\((D_{(2)})^4\) : Soft Dilation, with threshold value = 2, applied, “4” times on the image.

\((E_{(4)})^5\) : Soft Dilation, with threshold value = x, applied “y” times on the image.

\(D_{(1)}\), \(D_{(2)}\), \(D_{(3)}\) : Soft Dilation, applied with threshold values, 1, 2, 3 on the image.

\(D_{(4)}\), \(D_{(5)}\), \(D_{(6)}\) : Soft Dilation, applied with threshold values x, y, z on the image.

\((O (1, 2))^3\) : Soft open applied thrice on the image, with thresholds 1,2

\([\text{Soft Erosion threshold value } = 1, \text{ Soft Dilation threshold value } = 2]\)

\((O (x, y))^n\) : Soft open, applied ‘n’ times, on the image, with thresholds x, y

\([\text{Soft Erosion threshold value } = x, \text{ Soft Dilation threshold value } = y]\)

\(O(p, q) O(x, y)\) : Soft Open applied twice on the image, with different thresholds.

\(O (p, q) O (r, s) O (x, y)\) : Soft open, applied thrice on the image, with different thresholds.

\((C (1, 2))^4\) : Soft close applied four number of times on the image, with Soft dilation threshold value = 1, Soft Erosion threshold value = 2.

\([\text{Soft Erosion threshold value } = 1, \text{ Soft Dilation threshold value } = 2]\)

\((C (1, 2))^n\) : Soft close applied “n” number of times, on the image with thresholds 1, 2.

\((C(x, y))^n\) : Soft close applied “n” times, on the image, with thresholds x, y.

\((C(p, q) C(r, s) C(t, u)\) : Soft close applied on the image, thrice, with different thresholds.

3.2 Review On Soft Morphology:

CHANF – CHEF CHAOUNI, M etc developed a process for convergence criteria, in iterative morphology. In iterative morphology, the system has to go towards a better solution. It is discussed in this paper (13). XIA – YONG and others proposed an algorithm in iterative morphological environment, for segmentation.

JIWEI YUAN & others, (14) discussed methodology for segmentation technique, which is suitable to apply on sequence of images of traffic scenes.
YONG XIA & others (15), discussed methodology using multi fractal estimation technique for image segmentation using iterative dilation scheme.

AUPIGITER. R. also discussed (16) segmentation using iterative watershed algorithm in 3D environment, which is suitable for medical image processing. ZHANG XIAO – JING & others discussed (17) segmentation using watershed algorithm, to be applied in medical area, using iterative erosion technique.

ZHANG, H; & others – (18) discussed methodology for smoothing (for the treatment of impulse Gaussian noises) using iterative close – open technique. SKOLNICK, M.M etc (19) discussed determination of centroids using iterative morphology. J.G.POSTAIRE & others (20) discussed the role of iterative morphology in cluster analysis. There are so many applications, where iterative morphology may be applied.

The S.E.’s, having series, and in increasing size [like mentioned above] is called multi scale S.E.’s and the morphological approach (operations) dealing with multi scale S.E.’s is called multi scale morphology. As the size of the S.E. is more, its impact upon image will be more. For example, amount of expansion by applying dilation operation is more on an image, if we apply 5/5 S.E., compared to amount of expansion of image, by dilating by 3/3 S.E.

If Multi Scale Soft Morphology and iterative soft morphology are combined, a new area Multi Scale iterative Soft Morphology Emerges. [MSISM]

4.2 Review On Multi Scale Soft Morphology

Till now, some amount of research is done in this area, and it is applied in so many areas.

IV. MULTI SCALE SOFT MORPHOLOGY

4.1 Discussion On Multi Scale Soft Morphology

In the process of understanding the objective world, the appearance of an object does not depend only on the object itself, but also on the scale that the observer used. It seems that appearance under a specific scale does not give sufficient information about the essence of the percept, we want to understand. If we use a different scale, to examine this percept, it will usually have a different appearance. So, this series of images and its changing pattern over scales reflect the nature of the percept.

The S.E. dimension can be anything. It depends upon situation, requirement, and context etc. It can be 1/1, 2/2, 3/3, 4/4, 5/5, 6/6, 7/7,………

In some situations, particularly square grid is chosen, it can be 3/3, 5/5, 7/7, 9/9, 11/11, 13/13,………

For example, it can be

\[
\begin{pmatrix}
1 & 1 & 1 \\
1 & 1 & 1 \\
1 & 1 & 1
\end{pmatrix}
\]

OR

\[
\begin{pmatrix}
1 & 1 & 1 & 1 & 1 \\
1 & 1 & 1 & 1 & 1 \\
1 & 1 & 1 & 1 & 1 \\
1 & 1 & 1 & 1 & 1 \\
1 & 1 & 1 & 1 & 1
\end{pmatrix}
\]

In mathematical morphology also, a new area multi scale mathematical morphology is developed, and applied in so many areas like smoothing, edge enhancement, analysis of radar imagery, remote sensing, medical image processing etc.

PETROS MARAGOS entered into multi scale morphology, in addition to other areas. He explained about changes of shapes, as the scale is changed. He explained the applications of MSMM, and back ground mathematics. He explained about application of MSMM in skeletonization also. He extended these concepts to gray scale, also (21). MING – HUA CHEN & PING – GAN YAN explained (22) Erosion, Dilation, Close in multi scale environment, with diagrams (results), mathematical analysis, as well as symbolic conventions.

PAUL. T. JACKWAY etc. (49) provided one type of analysis in MSMM. They discussed how to relate the results of one scale with the results at different scale.
They have provided this analysis with good examples, using Erosion/Dilation morphological operations. This paper discussed the B.G. theory, in one angle, relating to MSMM.

KUN WANG etc. proposed an algorithm, for edge detection in the presence of Gaussian noise & salt-pepper noise in multi scale morphological environment. The experimental results are better than that of conventional algorithms (23). The same authors KUNWANG etc. proposed another algorithm for edge detection (24) which will function better in Gaussian, salt-paper noise environment, in MS morphological approach.

KIM WANG and others discussed an edge detection algorithm, in multi scale environment, which is suitable to apply on brain MRI, in noisy environment. (25).

Runway detector plays a very important role in synthetic vision system, which is helpful for pilots. But the infrared image constructed in this situation which will help pilot, will have heavy noise and bad contrast. Suitable to this situation, a multi scale morphological edge detector is proposed, which will help the pilot, for his, environmental awareness. So, MSMM is having, its applications, in aviation areas also. YANG SHANMIN and others discussed above MSMM concept. (26).

GAO LI etc (27) proposed an adaptive algorithm for edge detection of a color image (in HIS space) in MSMM environment. CHEN JIN LONG, etc. proposed another methodology for edge detection in multi structure and multi scale mathematical morphology environment (28).

ZHANG ANU & others have proposed another algorithm (29) for identification of weak edges in Oct images using MSMM environment, XINGHUI ZAANG etc. (30) proposed another algorithm for edge detection in color image environment, using MSMM.

Another algorithm for smoothing is discussed using MSMM. (31). XU, YANLEI; ZHAO, JIYIN discussed (32) another algorithm, for edge detection, using MSMM, in noisy environment.

JIANG–HUI TAN etc. proposed (33) a new type of process using MSMM for smoothing of infrared imagery. It will have complexity due to noise. Using this methodology, they protected details also.

These MSMM techniques are extended to segmentation also. DEBAY LE, J. etc (34) extended MSMM for segmentation using adaptive technique and MARC DROSKE etc. also (35) used MSMM for segmentation. (36) H UANG, R. etc. discussed extension of MSMM to 3D. They discussed and designed algorithm for volume segmentation. For this purpose, they have designed spherical S. E.’s at various sizes. LETITIA, S; etc. applied MSMM for road segmentation from satellite aerial images (37).

JIANN–JONE CHEN etc. extended the MSMM to 3D segmentation, using dual (MS morphological) concepts (38).

SHU LI; etc. (39) designed water sheds segmentation algorithm, using MSMM, and applied to cell image segmentation, and got quality results. XU YING SHA; etc (40) proposed another water shed algorithm for segmentation of remote sensing images, in MSMM environment. It shows good results, by avoiding, over segmentation.

SHUWEI LI etc. (41) proposed method, to generate DTM and to maintain the terrain details, based on MSMM [here DTM means, Digital Terrain Model].

MSMM is having, application in medical area also. (42) DA WEI QI etc. shown an application in medical I.P. for edge detection in noisy environment, which gives better results, compared to traditional pictures. FEI ZHANG etc., given another algorithm (43), suitable for ECG analysis, in impulse noise environment using MSMM. DAWEI QI (44) proposed another algorithm, for medical analysis environment. JI – LE HU; etc. (45) proposed another algorithm, in ECG analysis, which provided suitable and good decisions, at critical points. It is a decision making algorithm regarding heart using MSMM.

Some relevant concepts are discussed in 46, 47, 48 which are related to soft mathematical morphology.

V. EQUALITY IN BETWEEN ITERATIVE SOFT DILATION AND ITERATIVE SOFT OPEN IN MULTI SCALE ENVIRONMENT

In this section these equalities are discussed structuring element dimension wise. In this section some important symbolic representation (or nomenclature) is also introduced and discussed.
5.1 Structuring Element:

5.1.1 Threshold = 1:
Threshold value fixed at 1.

\[
\text{Formula for iterative soft dilation (applied twice on an image)} = (D(1)D(1))
\]
\[
= (E(9)D(1)) \quad [\because D(1) = E(9)]
\]
\[
= 0(9,1) \quad \because (D(1))^2 = 0(9,1)
\]

\[
\text{Formula for iterative soft erosion (applied four times on an image)} = (D(1)D(1)D(1)D(1))
\]
\[
= (E(9)D(1)E(9)D(1)) \quad [\because D(1) = E(9)]
\]
\[
= (O(9,1)) \quad \because (D(1))^4 = (O(9,1))^2
\]

\[
\text{Formula for iterative soft dilation (applied six times on an image)} = (D(1)D(1)D(1)D(1)D(1)D(1))
\]
\[
= (E(9)D(1)E(9)D(1)E(9)D(1)E(9)D(1)) \quad [\because D(1) = E(9)]
\]
\[
= (O(9,1))O(9,1)O(9,1)O(9,1) \quad \because (D(1))^6 = (O(9,1))^3
\]

\[
\text{Formula for iterative soft dilation (applied ten times on an image)} = (D(1)D(1)D(1)D(1)D(1)D(1)D(1)D(1)D(1)D(1))
\]
\[
= (E(9)D(1)E(9)D(1)E(9)D(1)E(9)D(1)E(9)D(1)) \quad [\because D(1) = E(9)]
\]
\[
= (O(9,1))O(9,1)O(9,1)O(9,1)O(9,1) \quad \because (D(1))^{10} = (O(9,1))^5
\]

\[
\text{Formula for iterative soft dilation (applied 2n times on an image)} = (D(1)D(1)D(1)D(1)D(1)D(1)D(1)D(1) \ldots \ D(1)D(1))
\]
\[
= (E(9)D(1)E(9)D(1)E(9)D(1) \ldots \ E(9)D(1)) \quad [\because D(1) = E(9)]
\]
\[
= (O(9,1))O(9,1)O(9,1) \ldots O(9,1) \quad \because (D(1))^{2n} = (O(9,1))^n
\]

5.1.2 Threshold = 7:
Threshold value fixed at 7.

\[
\text{Formula for iterative soft dilation (applied twice on an image)} = (D(7)D(7))
\]
\[
= (E(3)D(7)) \quad [\because D(7) = E(3)]
\]
\[
= 0(3,7) \quad \because (D(7))^2 = 0(3,7)
\]

\[
\text{Formula for iterative soft dilation (applied four times on an image)} = (D(7)D(7)D(7)D(7))
\]
\[
= (E(3)D(7)E(3)D(7)) \quad [\because D(7) = E(3)]
\]
\[
= (O(3,7))O(3,7) \quad \because (D(7))^4 = (O(3,7))^2
\]
5.1.3 Threshold = m:
In general let threshold value = m

\[
\text{Formula for iterative soft dilation} \quad \text{applied six times on an image} \quad \begin{array}{c}
\quad = (D(7)D(7)D(7)D(7)D(7)D(7)) \\
\quad = (E(3)D(7)E(3)D(7)E(3)D(7)E(3)) \quad [\because D(7) = E(3)] \\
\quad = (O(3,7)O(3,7)O(3,7)O(3,7)) \quad [\because D(7) = E(3)] \\
\quad = (O(3,7))^6 \quad \therefore (D(7))^6 = (O(3,7))^6
\end{array}
\]

\[
\text{Formula for iterative soft dilation} \quad \text{applied ten times on an image} \quad \begin{array}{c}
\quad = (E(3)D(7)E(3)D(7)E(3)D(7)E(3)D(7)E(3)D(7)) \quad [\because D(7) = E(3)] \\
\quad = (O(3,7)O(3,7)O(3,7)O(3,7)O(3,7)O(3,7)) \quad [\because D(7) = E(3)] \\
\quad = (O(3,7))^5 \quad \therefore (D(7))^{10} = (O(3,7))^5
\end{array}
\]

\[
\text{Formula for iterative soft dilation} \quad \text{applied 2n times on an image} \quad \begin{array}{c}
\quad = (D(7)D(7)D(7)D(7)D(7)D(7) \cdots D(7)D(7)) \\
\quad = (E(3)D(7)E(3)D(7)E(3)D(7) \cdots E(3)D(7)) \quad [\because D(7) = E(3)] \\
\quad = (O(3,7)O(3,7)O(3,7)O(3,7) \cdots O(3,7)) \\
\quad = (O(3,7))^n \quad \therefore (D(7))^{2n} = (O(3,7))^n
\end{array}
\]

5.2 Structuring Element:

5.2.1 Threshold = 1:
Threshold value fixed at 1.

\[
\text{Formula for iterative soft dilation} \quad \text{applied twice on an image} \quad \begin{array}{c}
\quad = (D(1)D(1)) \\
\quad = (E(25)D(1)) \quad [\because D(1) = E(25)] \\
\quad = O(25,1) \quad \therefore (D(1))^2 = O(25,1)
\end{array}
\]

\[
\text{Formula for iterative soft dilation} \quad \text{applied four times on an image} \quad \begin{array}{c}
\quad = (D(1)D(1)D(1)D(1)) \\
\quad = (E(25)D(1)E(25)D(1)) \quad [\because D(1) = E(25)]
\end{array}
\]

281
5.2.2 Threshold = 15:

Threshold value fixed at 15.

\[
\begin{align*}
\text{Formula for iterative soft dilation} & \quad \text{applied twice on an image} \\
\Rightarrow \quad (D(15))^2 &= \text{O}(11,15) \\
\Rightarrow \quad (D(15))^2 &= \text{O}(11,15) \\
\Rightarrow \quad (D(15))^4 &= \text{O}(11,15)^2 \\
\Rightarrow \quad (D(15))^6 &= \text{O}(11,15)^3 \\
\end{align*}
\]
\( \text{Formula for iterative soft dilation applied} \)
\[ \text{on an image} \]
\[ = (O(11,15)O(11,15)O(11,15)O(11,15)O(11,15)) \]
\[ = (O(11,15))^5 \quad \therefore (D(15))^5 = (O(11,15))^5 \]

\[ \text{Formula for iterative soft dilation} \]
\[ \text{applied} \]
\[ \text{2n times on} \]
\[ \text{an image} \]
\[ = (O(11,15)O(11,15)O(11,15)O(11,15)O(11,15)) \]
\[ = (O(11,15))^n \quad \therefore (D(15))^n = (O(11,15))^n \]

5.2.3 Threshold = m:

In general let threshold value = m

\[ \text{Formula for iterative soft dilation} \]
\[ \text{applied} \]
\[ \text{2n times on} \]
\[ \text{an image} \]
\[ = E(26-m)D(m)E(26-m)D(m)E(26-m)D(m)E(26-m)D(m) \] \[ \vdots E(26-m)D(m) \]
\[ = O(26-m,m)O(26-m,m)O(26-m,m)O(26-m,m) \] \[ \vdots O(26-m,m) \]
\[ \text{So } (D(m))^n = (O(26-m,m))^n \]

5.3 \( \frac{7}{4} \) Structuring Element:

5.3.1 \( Th=1 \):

Threshold value fixed at 1.

\[ \text{Formula for iterative soft erosion} \]
\[ \text{applied twice on an image} \]
\[ = (E(49)D(1)) \quad \therefore (1) = E(49) \]
\[ = O(49,1) \quad \therefore (D(1))^2 = O(49,1) \]

\[ \text{Formula for iterative soft dilation} \]
\[ \text{applied four times on an image} \]
\[ = (E(49)D(1)E(49)D(1)) \quad \therefore (D(1)) = E(49) \]
\[ = (O(49,1)O(49,1)) \]
\[ = (O(49,1))^2 \quad \therefore (D(1))^4 = (O(49,1))^2 \]
5.3.2 Th=35:

Threshold value fixed at 35. 

**Formula for iterative soft dilation applied twice on an image**

\[ = (D(35)D(35)) \]

\[ = O(15,35) \]

\[ : (D(35))^2 = O(15,35) \]

**Formula for iterative soft dilation applied four times on an image**

\[ = (D(35)D(35)D(35)D(35)) \]

\[ = O(15,35)(15,35)) \]

\[ : (D(35))^4 = (O(15,35))^2 \]

**Formula for iterative soft dilation applied six times on an image**

\[ = (D(35)D(35)(15,35)) \]

\[ = O(15,35)D(15,35)) \]

\[ : (D(35))^6 = (O(15,35))^3 \]

\[ = O(15,35)(15,35) \]

\[ : D(15) = E(15) \]

\[ (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\[ : (D(1)) = (E(49)) \]

\end{align*}
\]

In the same way the formulae may be developed for $11/11, 13/13, 15/15, 17/17, 19/19$ ... structuring elements.
VI. RESULTS AND DISCUSSIONS

In this section the above equalities are discussed in practical point of view.

These equalities are checked/verified on semi-circle and dumbbell shapes. The results are available in the database of the author.

In this paper the sample results, like a few results of semi-circle shapes are taken and these are tabulated in a systematic way. Initially the results are presented in 3/3 environment, and equality in between iterative soft dilation and iterative soft open are established.

Here, the dilation twice with threshold value is equal to one, is equivalent to open at thresholds 9 and 1. We get the same value, which is equal to 5870, in 3/3 window environment.

In the same way here, the dilation six times with threshold value is equal to four, is equivalent to open at thresholds 6 and 4, three times. We get the same value, which is equal to 4860, in 3/3 window environment.

In the same way here, the dilation eight times with threshold value is equal to five, is equivalent to open at thresholds 5 and 5, four times. We get the same value, which is equal to 4583, in 3/3 window environment.

In the same way here, the dilation six times with threshold value is equal to eight, is equivalent to open at thresholds 2 and 8, three times. We get the same value, which is equal to 2357, in 3/3 window environment.

\[ O(w^2 + 1 - m, m)O(w^2 + 1 - m, m) \ldots O(w^2 + 1 - m, m) = (O(w^2 + 1 - m, m))^n \]

We get the same value, which is equal to 8982, in 3/3 window environment.

In the same way here, the dilation eight times with threshold value is equal to two, is equivalent to open at thresholds 8 and 2, four times. We get the same value, which is equal to 8832, in 3/3 window environment.

In the same way here, the dilation six times with threshold value is equal to four, is equivalent to open at thresholds 6 and 4, three times. We get the same value, which is equal to 4860, in 3/3 window environment.

In the same way here, the dilation eight times with threshold value is equal to five, is equivalent to open at thresholds 5 and 5, four times. We get the same value, which is equal to 4583, in 3/3 window environment.

In the same way here, the dilation six times with threshold value is equal to eight, is equivalent to open at thresholds 2 and 8, three times. We get the same value, which is equal to 2357, in 3/3 window environment.

</table>
In the same way here, the dilation eight times with threshold value is equal to one, is equivalent to open at thresholds 25 and 1, four times. We get the same value, which is equal to 17501, in 5/5 window environment.

In the same way here, the dilation twice with threshold value is equal to two, is equivalent to open at thresholds 24 and 2, once. We get the same value, which is equal to 6978, in 5/5 window environment.

In the same way here, the dilation eight times with threshold value is equal to twenty three, is equivalent to open at thresholds 3 and 23, four times. We get the same value, which is equal to 75, in 5/5 window environment.

In the same way here, the dilation six times with threshold value is equal to twenty four, is equivalent to open at thresholds 2 and 24, three times. We get the same value, which is equal to 425 in 5/5 window environment.

In the same way here, the dilation six times with threshold value is equal to three, is equivalent to open at thresholds 47 and 3, three times. We get the same value, which is equal to 17610 in 7/7 window environment.

The results are tabulated for 5/5, 7/7, 9/9 etc environments in the following tables.

#### VII. CONCLUSION

In this paper a fundamental rule called EQUALITY is discussed in multi scale and iterative environment. It will fill up gap on the fundamentals of mathematical soft morphology. Till now applications are discussed in various papers by various researchers, but fundamental properties are not touched. More over iterative morphology is having broad applications. so discussion of fundamental property in this context will lead to development of this area. Understanding of fundamental properties of any area will lead to development and expansion of that area, which will lead to excellent applications.

AUTHOR’S PROFILE
The author Kompella Venkata Ramana has done his B.E(E.C.E) and M.E(COMPUTER ENGINEERING) and Ph.D from ANDHRA UNIVERSITY, VISAKHAPATNAM, INDIA. He has started his carrier as LECTURER in N.I.T. (W). Later he shifted to ANDHRA UNIVERSITY. At present he is working as ASSOCIATE PROFESSOR in the department of computer science &systems engineering in ANDHRA UNIVERSITY. His areas of interest are Image Processing, Formal languages and Automata theory, compiler design and Systems Programming. He has written books on the above areas. He has experience of more than twenty five years in teaching and guided more than one hundred Thesis in M.Tech. Level, majority of them are in image processing.
He has done his Ph.D in computer engg.( image processing...mathematical soft morphology.)
